

Yuan-Sheng (Jan) Hsu — M.D., Ph.D.

Taichung, Taiwan

✉ dynush@gmail.com • ORCID: 0009-0004-8990-9823

Research Summary

Physician-scientist with research interests in bone and mineral health and clinical pharmacoepidemiology. Current work focuses on polygenic risk scores for osteoporotic fracture prediction in a Taiwanese DXA-linked biobank cohort, real-world evidence studies of skeletal disease using federated networks, and causal-inference methods (target trial emulation, propensity score). Earlier doctoral training in basic biomedical research provides a foundation for evaluating mechanistic, translational, and epidemiologic evidence across scales.

Research Interests

Bone and mineral metabolism | Polygenic risk scores and fracture prediction | Real-world evidence and epidemiology | Causal inference for observational data

Education

China Medical University

M.D., Ph.D. in Medicine

Taichung, Taiwan

2015–2024

Ph.D. advisor: Academician Wen-Hwa Lee, Genomics Research Center, Academia Sinica

Dissertation: Differential effects of glucose and N-acetylglucosamine on genome instability

Honors and Awards

2026: Best Abstract Presentation Award (EGPT session), 41st Annual European Association of Urology (EAU) Congress, London

2023: Competitive Doctoral Dissertation Award, TSC Thesis Competition, Taiwan

2021: Certificate of Outstanding Poster, International Conference on Advanced Biomedical Sciences (ICABS), Taichung

Academic and Clinical Positions

Taichung Veterans General Hospital

Physician (PGY)

Taichung, Taiwan

Mar 2025–Present

- Lead an independent research program in bone and mineral health, mentored by Dr. Kun-Huei Chen (Chairman, Department of Orthopedic Surgery)
- Develop and validate polygenic risk scores derived from heel eBMD GWAS for major osteoporotic fracture prediction in a Taiwanese DXA-linked cohort, using Fine-Gray competing risk models, restricted cubic splines, and BMD-stratified subgroup analysis
- Conduct multi-departmental real-world evidence studies using the TriNetX federated network and institutional cohorts, applying target trial emulation, propensity score methods, and E-value sensitivity analysis

Ministry of National Defense

Substitute Military Service

Hualien, Taiwan

Aug 2024–Mar 2025

China Medical University Hospital

Clinical Data Analyst (concurrent with clerkship)

Taichung, Taiwan

Sep 2022–Aug 2024

- Designed and queried a hospital-scale data warehouse (~400,000 patient samples) using SQL and ICD diagnostic codes to define oncologic and matched-control cohorts
- Executed genome-wide association analyses on Linux using PLINK; identified significant loci and generated LocusZoom visualizations in a 1:5 matched case-control study of breast cancer

Genomics Research Center, Academia Sinica

Doctoral Researcher

Taipei, Taiwan

Mar 2018–Jul 2022

- Investigated mechanisms by which high-sugar diets induce pancreatic DNA damage through O-GlcNAcylation and nucleotide-metabolism disruption in the Wen-Hwa Lee laboratory
- Designed animal model studies comparing DNA damage across sugar types and dosages; performed LC-MS metabolomics for dNTP pool quantification
- Developed 96-well high-content imaging assays for DNA damage and protein glycosylation; conducted multiplex IHC with RNA SCOPE on precancerous pancreatic lesions

Conference Presentations

2026: Hsu JYS, Li JR, Yang CJ. Tadalafil improves cardiovascular and renal outcomes in kidney transplant recipients with benign prostate hyperplasia or erectile dysfunction. *41st Annual EAU Congress*, London, UK, March 2026.

Research Skills

Epidemiology & Statistics: Survival analysis (Cox, Fine-Gray competing risk), polygenic risk score derivation and validation (PRS-CS, PLINK, LDpred2), target trial emulation, propensity score methods, restricted cubic splines, E-value sensitivity analysis

Programming & Data: R (tidyverse, survival, rms), Python (pandas, scikit-learn, PyTorch), SQL, Linux, Git, Jupyter

Genomics & Bioinformatics: PLINK, GWAS pipelines, LocusZoom, PGS Catalog integration

Biomedical Research: Western blot, IP, IF, ELISA, LC-MS metabolomics, high-content imaging, multiplex IHC with RNA SCOPE, spinning-disk confocal microscopy, animal model design

Research Databases: TriNetX federated network, Taiwan Precision Medicine Initiative (TPMI), hospital data-warehouse design
